THE 1943 CROP SEASON

The 1943 season was marked with several adverse conditions, yet crop production was very good. Temperatures in September and October 1942 were a little below normal, and rainfall was about one-half of normal. The droughty condition of these two months was a hindrance to wheat seeding, in that some people thought moisture was insufficient for wheat germination, which partially accounted for the sharp reduction in the acreage of wheat seeded. In Indiana, since the advent of the soybean, much wheat is seeded following this crop. The dry October was favorable to soybean harvest, but the greatly expanded soybean acreage and a shortage of combines caused a great delay in soybean harvest. The failure to get soybeans harvested was another cause of the reduced winter wheat seeding.

Temperatures in November were about normal, and precipitation about twice the normal amount which aided the winter wheat in making up some lost time due to late seeding and droughty conditions. On the first day of December winter set in with much of the state blanketed with six inches of snow which remained for nearly a month, and was favorable to the tender wheat plants. During late January and early February day time temperatures were such that some plant growth started. This warm period was followed by very low temperatures which killed some of the fall sown small grains. The third week of February was again a period of growing temperatures which was followed by two weeks of very low temperatures. These low temperatures and sudden changes caused further winter killing of unprotected small grain and injured some fruit, especially peaches.

Spring field work began about March 27. From then until April 8 temperatures were well above normal and there was little precipitation, enabling farmers to seed nearly all of the spring oats during that time. Oats were generally seeded earlier in 1943 than for many years. Ordinarily, early oats seeding is followed by good oats yields, but this year poor yields resulted from causes later in the season. These causes were claimed to be nitrogen starvation due to heavy leaching from the May rains, root rot, and corn borer damage. This is the first year that any considerable number of corn borers have been found in oats, and it was due to corn not being up when the first brood moths emerged. Failure of the first brood moths to find corn for their egg laying probably resulted in less borer damage to corn than otherwise would have been the case. Borer damage to corn was very light.

Most of April and the first week of May was very favorable to spring farm work. Much of the corn and soybean seed bed preparation had been completed prior to the rains which started on May 9. Because of May rains, very little planting was done from May 10 to 29. All of the Wabash and west fork White River bottoms flooded, so that some of them were not planted until about July 1. The heavy May rains coupled with about normal temperatures were very favorable to grass crops which had been somewhat backward in developing.

Not over five percent of the corn was planted before May 10, and a smaller percentage of soybeans. Based on a special survey, it was found that by June 11 about 79 percent of the corn had been planted, 38 percent of the soybeans, and that an amount of spring plowing equal to 12 percent of the combined 1943 corn and soybean acreage was yet to be done. Most farmers, in spite of the lateness, kept on planting corn and soybeans until they had planted their entire acreage. The June planted corn and soybeans came up in four or five days whereas sometimes with earlier planting germination takes 10 days or more. The season ended with corn and soybeans not over about a week later than usual, except in some small localized areas such as two or three counties in the extreme northeast corner of the state and the river bottoms.

The entire growing season was very favorable for crop growth. From May 28 to September 10 there were only two weeks that both day and night temperatures were not above normal, and there were no extremely hot day temperatures to cause damage.

During this entire period the humidity was high which kept to a minimum the evaporation and transpiration. Moisture conditions were about optimum throughout the summer except a small area in the southwest corner of the state which turned a little dry toward the end of the season.

There were light frosts in low places about June 30 and September 10. Damage was light, except to some tender truck crops. The general killing frost in the fall occurred on October 17 compared with the average killing frost date of about October 12 to 14. Only a small acreage of corn and soybeans was not mature before the October 17 frost.

September and October were generally quite dry and favorable to the maturing of crops. By November 1, at least 75 percent of the soybeans had been combined and corn picking operations were well under way. Over much of the state soil conditions in the fall were such that some farmers complained about insufficient moisture for wheat germination but generally speaking wheat went into the winter in reasonably good condition even though the plants were not as large as normal.

Crop yields in Indiana in general were good in spite of the late planting season. Corn yielded 49.0 bushels compared with the 1932-41 average of 37.6; winter wheat 16.0 compared with 17.4; oats 23.0 compared with 28.4; barley 21.5 compared with 21.4; rye 12.0 compared with 12.4; soybeans for beans 18.5 compared with 16.4; all tame hay 1.35 tons compared with 1.22 tons.

ROBERT E. STRASZHEIM,
Agricultural Statistician.

MINER M. JUSTIN,
Agricultural Statistician.

TABLE I. SUMMARY OF THE ACREAGE, YIELD PER ACRE, PRODUCTION, AND SEASON AVERAGE PRICE OF
INDIANA CROPS, 1942-1943

WEST LAFAYETTE, INDIANA**

No. 209

February, 1943

LIVESTOCK SUMMARY, INDIANA, JANUARY 1, 1943

The numbers of all classes of meat animals and milk cows on farms January 1st is larger than a year ago. The numbers of chickens and turkeys are also larger, but horse and mule numbers are less than a year ago.

The number of horses on farms January 1 is estimated to be 273,000 head which is 8 percent less than a year ago. Horse numbers have been declining steadily each year since 1915 when the number was 854,000, the largest in the state since 1867. The present value per head is \$88 which is a 33 percent increase over a year ago compared with an increase of about 24 percent in the price received by farmers for all farm products sold.

The present number of mules on farms is 43,000 which is 10 percent less than a year ago. The number of mules is following a pattern similar to horse numbers with the peak number coming in 1916 and a general decline in numbers since that time. The January 1, 1943 value per head is \$109 which is 30 percent more than the previous year.

The number of all cattle on farms at 1,858,000 head is 4 percent more than a year earlier. The number of milk cows increased 1 percent during the year while other cattle increased a little more than 6 percent. The present number of all cattle is the largest since 1867 when records began. The value per head of all cattle on farms is estimated at \$77.50 or 23 percent more than a year ago. The milk cow value per head at \$103 is 24 percent more than a year ago. Judging by the January 1 numbers of milk cows on farms, at least a part of the recent talk about liquidation of dairy herds has been unwarranted. It would appear that dairy cows going to slaughter are largely cull cows and good dairy cows have found homes in other dairy barns in cases where liquidation of herds was necessary.

The number of stock sheep at 717,000 head is 2 percent greater than a year ago. Sheep and lambs on feed number 169,000 compared with 161,000 last year. The value per head of sheep is nearly 20 percent more than a year ago. The 1942 lamb crop was estimated to be 559,000 head which is the same number as the year before. Wool production in 1942 was estimated to be 5,490,000 pounds compared with 4,920,000 pounds in 1941.

There were 4,004,000 pigs saved in the spring of 1942 and 3,691,000 in the fall, making a total for the year of 7,695,000 head, which was by far the largest number for the period for which records are available since 1930. If farmers' intentions for the spring of 1943 are carried out, the 1943 spring pig crop will be considerably larger than the 1942 spring crop. The corn-hog price ratio was more favorable than average throughout the entire year. The large pig crops resulted in 12 percent more hogs on farms January 1, 1943 than the preceding January. The value per head is estimated to be \$22.20 or 44 percent more than a year earlier.

The number of hens and pullets of laying age on farms January 1, 1943 is 16,191,000 which is 13 percent more than a year ago. The number of other chickens is 2,454,000, making the number of all chickens 18,645,000. The number of turkeys on farms increased during the year from 67,000 to 77,000 head.

UNITED STATES

A sharp increase in hogs and cattle brought the number of livestock on U. S. farms on January 1, 1943 to a new all time record. The hog and cattle increase more than offset a reduction in sheep, horses and mules. This increase in numbers was accompanied by sharp increases in the value per head of all species with a resulting inventory value of livestock on farms much higher than in any previous year. When the numbers of the various species are converted to an animal unit basis which allows for the differences in size and feed requirements of the several species, the increase is about 5 percent; in terms of grain consuming animal units the increase during 1942 was about 11 percent; and in terms of hay and pasture units the increase was about 2 percent.

This record number of livestock is to a considerable extent the result of a record supply of grain and hay this season after 5 years of abundant supplies. Production of feed grains and production of hay in 1942 were each the largest of all years and carry-over stocks were large. As of January 1, farm supplies of feed grain per animal unit of livestock (including chickens) were the largest in 20 years and 3 percent above the 5-year average. This season's supply of hay per hay consuming unit was the second largest in more than 20 years and 6 percent above the 5-year average.

The increase in hog numbers during 1942 was the largest, and the percentage increase of 22 percent was the second largest on record. All classes of hogs were at record numbers. The increases for pigs under 6 months old and for sows and gilts for spring farrow were somewhat larger than the increase for other hogs over 6 months. With the large number of hogs on farms January 1, 1943—73,660,000 head—and a large increase in the 1943 spring pig crop in prospect, the slaughter supplies of hogs in 1943 will be much above the record supplies in 1942.

The upward swing in the cycle of cattle numbers continued through 1942 and carried the total of all cattle on farms to a new high of 78,170,000 head—over 3 million head larger than the previous record. The numbers of all classes and ages of cattle increased, with milk cow numbers up about 2 percent.

The number of all sheep on farms decreased during the year from the record number on January 1, 1942 after advancing continuously for 5 years. The number of stock sheep decreased about 3 percent to 48,308,000 head. The number of sheep and lambs on feed decreased about 2 percent to 6,781,000 head.

The downward trend of numbers of horses and mules continued through 1942. There was a rather sharp drop in the numbers of both horse and mule colts raised in 1942 from a year earlier, the number of horse colts being the smallest in 24 years of record.

The number of chickens on farms made a record increase during 1942 which brought the total on January 1, 1943 to a new high of 540,107,000 birds. Turkey numbers, on the other hand, were smaller on January 1, 1943 than the record number of a year earlier.

¹ Average number on farms during year, heifers that have not freshened excluded.

² Excludes milk sucked by calves and milk produced by cows not on farms.

**TABLE XVII. DISPOSITION OF MILK PRODUCED ON INDIANA FARMS,
1924-1942**

Year	Milk fed or consumed on farms where produced			Milk sold or utilized in preparation of dairy products sold from farms						
	Fed to calves	Consumed in the farm household		Total used on farms	In farm-churned butter sold	In wholesale deliveries to plants, dealers, etc.		In retail sales of milk and cream by farmers ¹		
		As milk or cream	As farm butter			As cream	As milk			
Million pounds
